PIPELINE />

SUMMER SCHOOL

< AI & AUTOMATION: CLEANING & ARCHIVING DATA />

"The first rule of any technology used in a business is that automation applied to an efficient operation will magnify the efficiency."

— **Bill Gates**

Introduction

In the Bootstrap, you successfully connected Google Forms to Gmail. However, you probably noticed a major issue in your final execution log: the data sent into the email was raw, unformatted JSON blocks full of technical IDs (`{"questionId":... "textAnswers":..."}`). This is completely unreadable for an editorial team.

Moreover, emails get lost easily. A professional workflow requires storing articles in a centralized workspace.

In this Project, you will upgrade your pipeline to **clean the data** and **archive it automatically into a structured Google Doc**, before sending a clean email notification.

The Case

Your School Digital Newspaper wants a clean dashboard. Instead of receiving raw, ugly code in their emails, the chief editors want every submission to be automatically compiled into a beautiful, dedicated Google Document that acts as the "Press Pitch Book".

Your goal is to intercept the form submission, extract only the clean text, append it professionally to a Google Doc, and send a clean email alert.

The Mission

You must update and expand your Make.com automation scenario.

Your upgraded pipeline must connect: **Google Forms -> Google Docs -> Gmail**.

Your pipeline must follow these strict technical requirements:

1. The Frontend (Google Forms)

- ✓ Keep using your Newspaper Draft Submission form with the 3 required questions (*Journalist Name, Article Title, Article Draft*).

2. The Archive Step: Google Docs

- ✓ Create a master Google Document named Digital Newspaper - Submissions Archive.
- ✓ Add a **Google Docs** module in your Make.com scenario using the **"Create a Document from a Template"** or **"Append text to a Document"** action.
- ✓ Every time a journalist submits a form, the scenario must append a new section to this file.

3. The Data Cleaning Constraint

- ✓ **NO RAW JSON:** You are strictly forbidden from mapping the raw response blocks.
- ✓ You must map **ONLY** the specific text values extracted from the form answers.
- ✓ Your Google Doc and your Gmail notification must be perfectly clean and formatted exactly like this:

New Submission Received

- **Journalist:** [Clean Name here, e.g., Emmanuel MACRON]
- **Title:** [Clean Title here]
- **Draft:** [Clean Text here]

```
The Journalist {"questionId":"0e4d8da4","textAnswers":{"answers":[{"value":"Emmanuel MACRON"}]}}wrote :  
{"questionId":"01435077","textAnswers":{"answers":[{"value":"We have to be understood by the rest of the world.  
And being European is not just defending a piece of land, it's being a citizen of the world having a specific  
relationship to universalism, to freedom, to culture. Sometimes it is too slow, for sure, and needs to be reformed,  
for sure. But it's the only place in the world where we decided to put human being at the core of every single  
project, from the Renaissance to the digital transition and artificial intelligence."}]}}
```

This is not OK: As you can see , the raw JSON is unreadable and unprofessional. You must extract only the clean text values from the form submission. There's "{ \"questionId\":... \"textAnswers\":...}" in the raw data, which is not human-readable.

4. The Action (Gmail Notification)

- ✓ Once the Google Doc is updated, the pipeline must send a clean confirmation email to your address.
- ✓ The email body must match the clean text layout above and must **not** contain any technical brackets or IDs.

Deliverables

At the end of this Project, you will learn how to build a fully automated editorial pipeline that cleans and archives data.

1. **The Upgraded Blueprint:** A Make.com scenario with 3 fully connected modules (Google Forms -> Google Docs -> Gmail).
2. **The Press Pitch Book:** Your `Digital Newspaper - Submissions Archive` Google Document, showing the submitted text cleanly formatted without any JSON syntax or IDs.
3. **The Clean Email:** A new email in your inbox that is fully human-readable.
