Summer Media

<Summer School - Web Dev>

The Project

<Create your Website>

The editor-in-chief has a vision but a disaster in execution.

Currently, the newspaper is a static shell. Articles are hardcoded by developers. The result is unmanageable.

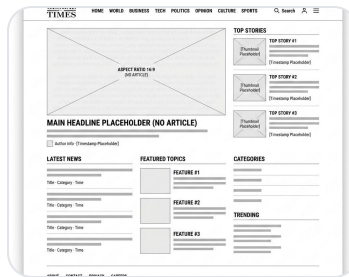

The Vision

<Building a Modern Media Platform>

We want to build the ultimate School Digital Newspaper. But what makes a modern media platform actually work?

- **The Interface:** It needs a beautiful, readable, and interactive design.
- **The Content:** It needs engaging, well-written articles.
- **The Workflow:** It needs a seamless system to review and publish stories automatically.

How do we build a complete media empire from scratch in just four days without collapsing under the workload?

Beautiful but Empty

The 3 AM Grind

Can automation and AI bridge the gap between
ambitious design and **sanity**?

Divide & Conquer

<A Newspaper Needs More Than Just Design>

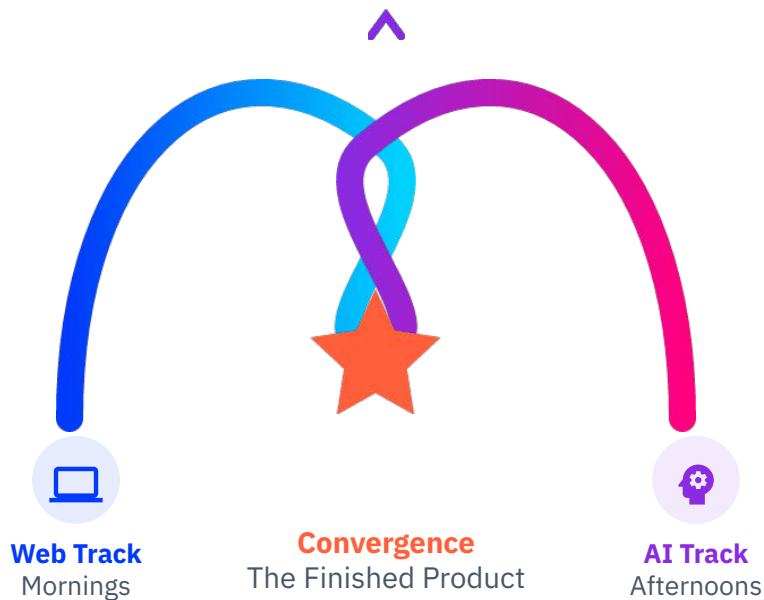

We are splitting the mission into two parallel tracks. You will build the car in the morning, and the engine in the afternoon.

Mornings (Web Development)

Building the visual frontend interface and the backend database architecture.

Afternoons (AI & Automation)

Leveraging AI to mass-generate content, enforce editorial rules, and build invisible data bridges.

The Foundation

<Day 1: The Foundation>

Web Track

Mastering the mechanics of the web. You will use Vanilla HTML and CSS to build the prototype of the media portal.

AI Track

You will learn Prompt Engineering to force Large Language Models to mass-produce the first batch of realistic articles for the website mockup.

Logic & Rules

<Day 2: Components & Assistants>

Web Track

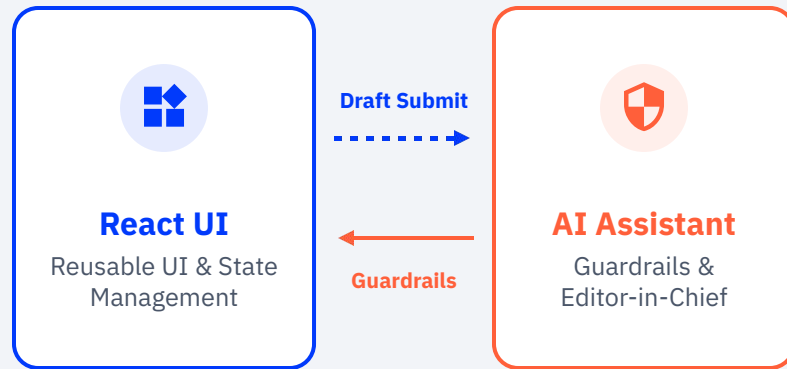

The Component Era. You will rebuild the newspaper using React, transforming static code into interactive, reusable components with state management.

AI Track

AI Product Design. You will build a permanent "Custom Assistant" that acts as a strict Editor-in-Chief, using Guardrails to automatically reject gossip and format incoming drafts.

Memory & Invisible Bridges

<Day 3: Data & Event-Driven Workflows>

Web Track

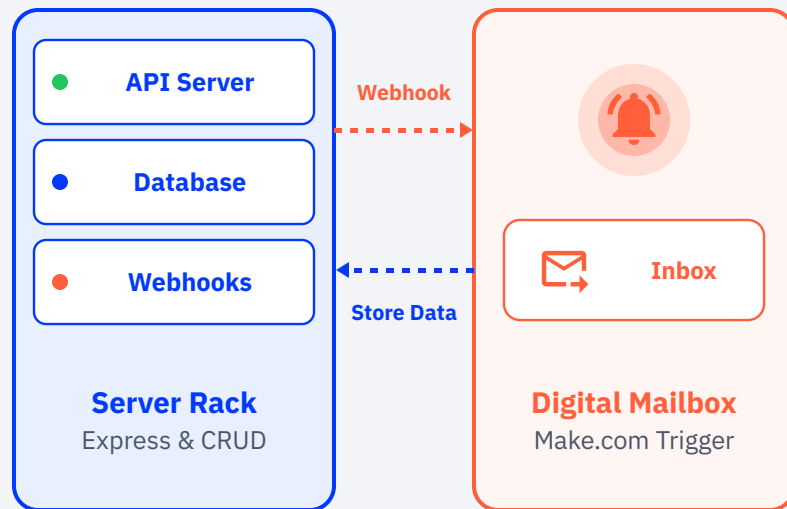

Behind the Scenes. You will build a Node/Express Back-End API (CRUD) so your application can actually remember its data permanently.

AI Track

The No-Code Pipeline. You will transition to Event-Driven architecture, using Make.com to set up Webhooks that instantly catch form submissions and archive them cleanly.

The Convergence

<Bonus: Tying It All Together>

Web Track

Full-Stack Integration. You will use `fetch` to connect your React interface to your Express API, bringing the newspaper to life with real database content.

AI Track

Breaking the Localhost Wall. You will use Ngrok to allow your cloud automation pipeline to inject live articles directly into your local code.

INTEGRATION SCHEMA

React UI
Client Port

Express API
Server Port

The Workflow

<The Automated Newsroom System>

Google Form

Make.com

AI Editor

Ngrok

Node/Express

React (The Website)

The Front-End (React)

What the reader sees. A responsive, dynamic interface presenting real-time curated articles.

The Back-End (Express)

The central engine room and database. Manages incoming payloads and updates structural content dynamic data.

The Editor-in-Chief (AI)

The brain that instantly processes, corrects, styles, and refines the submitted raw articles.

The Automation (Make / Ngrok)

The real-time instant bridge connecting forms, AI endpoints, local environments, and live web databases together.

How You Will Learn

<The Two-Step Method>

THE BOOTSTRAP (The Guide)

- A step-by-step, hand-held tutorial.
- A safe "sandbox" to discover and test new concepts.
- Follow the instructions, copy the code, and understand the magic.

THE PROJECT (The Mission)

- The real challenge. No more hand-holding.
- You must apply the concepts you just learned to build the actual newspaper features.
- Read the requirements, analyze the problem, and write your own code.
