SUMMER SCHOOL

< AI & AUTOMATION: UNDERSTANDING THE MACHINE />

"Any sufficiently advanced technology is indistinguishable from magic."
— **Arthur C. Clarke**

The Theory: Demystifying AI

Before you start generating content, you need to understand what you are actually talking to. You hear buzzwords everywhere: AI, Machine Learning, Deep Learning, LLMs. Let's break them down simply:

- ✓ **Artificial Intelligence (AI):** The broad concept of machines being able to carry out tasks in a way that we would consider "smart".
- ✓ **Machine Learning (ML):** A subset of AI. Instead of giving a computer a strict set of rules (like standard programming), we give it thousands of examples and let it find the patterns itself. Imagine teaching a computer what a cat is by showing it 10,000 pictures of cats.
- ✓ **Deep Learning (DL):** A specific type of Machine Learning inspired by the human brain. It uses "Artificial Neural Networks" with multiple layers to process highly complex data, like recognizing speech or driving a car.
- ✓ **Large Language Models (LLMs):** This is what ChatGPT, Claude, and Gemini are. They are Deep Learning models trained on almost the entire internet. But here is the secret: **they do not "think"**. An LLM is essentially the world's most advanced autocomplete. It calculates the statistical probability of what the next word should be based on the context you provide.

The Case

Welcome to the "Automated Newsroom". Your Web Development team is building the School Digital Newspaper. However, a newspaper without articles is just an empty shell.

Instead of writing fake news manually for hours, you are going to leverage Large Language Models (LLMs) to do the heavy lifting. You will use the Prompting techniques to command the AI to generate the exact content your Web team needs.

Project Requirements

Your only mission today is to provide the content for the website's homepage.

Open a free LLM interface (ChatGPT, Claude, or Gemini). You must write a prompt to force the AI to generate **exactly 5 real newspaper articles**.

Your prompt must enforce the following strict constraints:

1. **Catchy Title:** Each article must have an engaging, click-worthy title.
2. **Journalistic Tone:** The text must sound like it was written by a real, professional student journalist (informative, objective, but engaging).
3. **Length Limit:** No article can exceed **100 words**.
4. **Topics:** The 5 topics must be related to campus life (e.g., a new cafeteria menu, a late-night coding session, a student gaming tournament, an upcoming exam period, and a tech workshop).

The Challenge: If the AI writes 150 words for an article, or if the tone sounds like a robot reading a dictionary, your prompt failed. You must adjust your instructions and try again until the AI obeys all 4 constraints perfectly.

Deliverables

After you have successfully generated the 5 articles, you should know how to write a perfect prompt.

1. **The Master Prompt:** A text file containing the exact prompt you used to get the perfect result.
2. **The Content:** A text file containing the 5 generated articles. You will keep this file safe; you will need it later this week to copy-paste the text into your Web Development React application!
