< PART 3 BOOTSTRAP - THE AUTOMATION
PIPELINE />

SUMMER SCHOOL

< AI & AUTOMATION: CONNECTING THE DOTS />

"Automation is driving the decline of banal and repetitive tasks."
— **Klaus Schwab**

Introduction

Welcome to the world of No-Code Automation! Until now, your AI tools have lived in isolation. You had to copy text from one place and paste it into another.

Today, you will learn how to build digital bridges using **Make.com**. Make is a visual automation platform that allows you to connect over 1000 different applications together without writing a single line of code. You build workflows (called "Scenarios") by linking visual bubbles (called "Modules").

In this Bootstrap, we will build a simple but powerful pipeline: an automated notification system connecting Google Forms to Gmail.

Step 1: The Frontend (Google Forms)

Before we can automate anything, we need a place for users to input data. We will create a simple submission portal.

1. Go to [Google Forms](#) and ensure you are logged in with your Google account.
2. Click on **Blank form** to create a new one.
3. Title your form: Newspaper Draft Submission.
4. Add exactly 3 questions. Make sure they are all marked as **Required**:
 - ✓ **Journalist Name** (Type: Short answer)
 - ✓ **Article Title** (Type: Short answer)
 - ✓ **Article Draft** (Type: Paragraph / Long text)
5. Keep this tab open. Your frontend is ready!

The screenshot shows a Google Form titled "Newspaper Draft Submission". The form is set to "Published" (Publié) and is currently in the "Questions" tab. It contains three required questions:

- Journalist Name *** (Type: Réponse courte)
- Article Title *** (Type: Réponse courte)
- Article Draft *** (Type: Réponse longue)

The form is displayed in a web browser window with the title "Newspaper Draft Submission" and a star icon in the address bar. The Google Forms interface includes a top bar with icons for adding questions, a help icon, a preview icon, a back icon, a forward icon, a share icon, a "Publié" button, and a user profile icon. The form itself has a light blue background and a white border. The questions are arranged vertically, each with a title, a required field indicator (*), and a response type label. The "Article Draft" question is a long text area.

Step 2: The Workspace (Make.com)

Now, let's open the engine room.

1. Go to [Make.com](https://make.com) and create a free account (you can sign up with Google).
2. Once on your dashboard, click the purple **"Create a new scenario"** button in the top right corner.
3. Welcome to the visual editor! This infinite grid is where you will build your pipeline.

Step 3: The Listener (The Trigger)

Every automation needs a trigger to start. Our trigger is someone submitting the Google Form.

1. Click the huge **+** button in the middle of the screen.
2. Search for **Google Forms** and select it.
3. Choose the **"Watch Responses"** trigger.
4. Click **"Create a connection"** and log in with your Google account to give Make.com permission to read your forms.
5. In the "Form ID" dropdown, select your Newspaper Draft Submission form.
6. Click **OK**. You have just created a "Listener"! Make.com is now actively watching your form.

The Initialization Test: Before moving forward, you MUST generate some test data. Go back to your Google Form tab, click on the link icon to get the shareable link, and submit a fake article. This will allow Make.com to catch the data and initialize your scenario.

Step 4: The Action (Gmail)

Now that Make.com caught the data, we need to tell it what to do with it. We want it to send an email.

1. Hover your mouse on the right side of your Google Forms module and click the small **"Add another module"** button.
2. Search for **Gmail** and select the **"Send an Email"** action.
3. Click "Create a connection" to link your Gmail account.
4. **To:** Enter your own email address (so you can test it).
5. **Subject:** Type "New Article Submitted: " and then click on the empty space.

The Magic of Mapping: When you click inside a text box in Make.com, a menu pops up. This menu contains the data caught by the previous module (your Google Form). You can literally drag and drop the Article Title variable into your Subject line!

6. **Content:** Write a nice message and use "Mapping" to inject the Journalist Name and the Article Draft directly into the body of the email.
7. Click **OK**.

Step 5: Closing the Loop (The Final Test)

Your pipeline is fully connected. Let's see it in action.

1. At the bottom left of the Make.com screen, click the **"Run once"** button. The radar animation means the system is waiting.
2. Quickly go back to your Google Form and submit a brand new fake article.
3. Switch back to Make.com. You should see an animation as the data flows from the Form module to the Gmail module, leaving beautiful green checkmarks!
4. **Check your Gmail inbox.** You should have received an automated email with the exact title, name, and text you just submitted.

```
The Journalist {"questionId":"0e4d8da4","textAnswers":{"answers":[{"value":"Emmanuel MACRON"}]}}wrote :  
{"questionId":"01435077","textAnswers":{"answers":[{"value":"We have to be understood by the rest of the world.  
And being European is not just defending a piece of land, it's being a citizen of the world having a specific  
relationship to universalism, to freedom, to culture. Sometimes it is too slow, for sure, and needs to be reformed,  
for sure. But it's the only place in the world where we decided to put human being at the core of every single  
project, from the Renaissance to the digital transition and artificial intelligence."}]}}
```

Conclusion

Congratulations! You just built your first Event-Driven Automation Pipeline.

- You learned how to set up a **Trigger** (Webhook/Listener).
- You learned how to execute an **Action**.
- You learned how to **Map** variables from one app to another.

You are now ready to read the Project guidelines and validate this module!
